

GLITTERY SNOW SLIME!

- PVA or clear glue
- Bicarbonate of Soda
- Contact Lens Solution
- Glitter

Step 1

Squeeze 1 cup of the glue into a clean mixing bowl.

Step 2

Measure out 1 teaspoon of bicarbonate of soda and mix together well with the glue.

Step 3

Add glitter, then mix it into the glue and bicarbonate of soda mixture until it has fully blended.

Step 4

Measure out 1 tablespoon of contact lens solution and add to the mix.

Step 5

Continue to combine until the mixture starts to become stringy and come away from the edges of the mixing bowl. Take the mixture out of the bowl and start kneading it with your hands. You may need to do this for about 30 seconds, or until it stops sticking to your fingers. It should become elastic and super stretchy.

If it is still too sticky, just add a few more drops of contact lens solution to the mixture.

TIP!!! Make sure your Contact Lens Solution has "boric acid" in the ingredients list or it won't activate the bicarb soda!

Voilà! Glittery Snow Slime!!
